### Synthetic Data and Artificial Neural Networks for Natural Scene Text Recognition

Max Jaderberg, Karen Simonyan, Andrea Vedaldi, Andrew Zisserman Visual Geometry Group, Department of Engineering Science, University of Oxford, UK

#### 2. SYNTHETIC DATA ENGINE 1. OVERVIEW

1. Font rendering

**GENERATOR** 

generator

2. Border/shadow & colour

3. Composition

GENERATOF

generato

GENERATOR

Text recognition in natural scene images.

#### Contributions

- A synthetic data engine to generate unlimited training data.
- Three deep convolutional neural network (CNN) architectures for holistic image classification.
- A resulting set of state-of-the-art reading systems in language constrained and unconstrained scenarios.

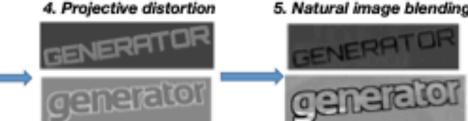

Existing scene text datasets are very small, and cover a small number of words.

Use a synthetic data engine to generate training

Fonts selected from 1400 Google Fonts.

Projective distortion, elastic distortion, and noise

Random crops of natural images alpha-blended with image-layers to generate texture and lighting.

#### Download at:

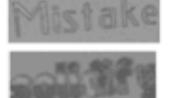

Dataset Available!

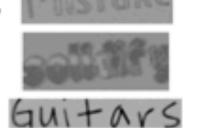

Covering 90k English words

9 million word images

www.robots.ox.ac.uk/~vgg/data/text/

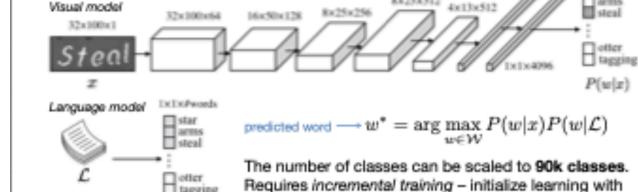

#### 3. MODELS

#### DICTIONARY ENCODING (DICT)

Multi-class classification, one class for each word w in dictionary W(constrained language model):

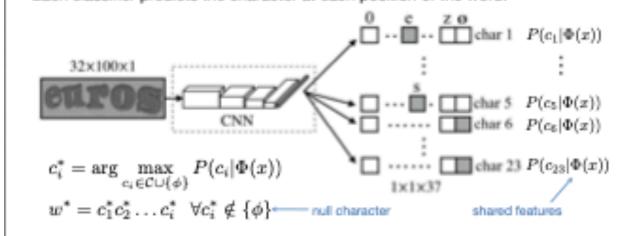

#### (movie subtities) $P(w|\mathcal{L})$ as learning progresses.

5k classes, incrementally increase number of classes

#### CHARACTER SEQUENCE ENCODING (CHAR)

Single CNN with multiple independent classifiers, inspired by Goodfellow et al ICLR'14. Each classifier predicts the character at each position of the word.

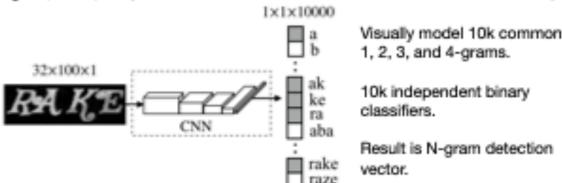

No language model, suitable for unconstrained recognition.

#### 4. EXPERIMENTAL SETUP

#### BAG OF N-GRAMS ENCODING (NGRAM)

Represent a string as a bag-of-N-grams.

E.g.  $G(spires) = \{s, p, i, r, e, s, sp, pi, ir, re, es, spi, pir, ire, res, spire, pires \}$ 

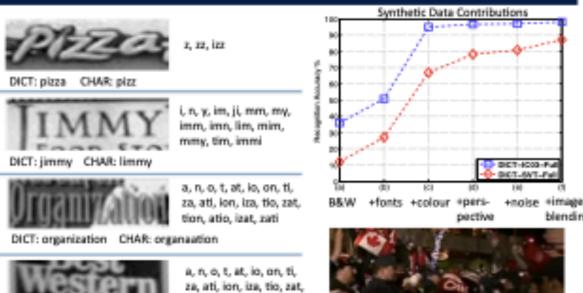

Two ways to recover words:

DICT: western CHAR: western

- Find nearest neighbour of output with ideal outputs of dictionary words.
- Train a linear SVM for each dictionary word, using training data outputs.

#### 5. EVALUATION

tion, atio, izat, zati

## Text Recognition

### Препроцессинг

### Реализовать:

### Test (no augmentation):

- 1. Vertical resize (с сохранением пропорций изображения до высоты 32 пикселя)
- 2. Horizontal resize (в случае, если ширина превышает фиксированный максимальный размер, например, 500 пикселей)
- 3. Image whitening (посчитать среднее значение по каждому каналу на части обучающей выборки), а затем вычитать соответствующее среднее из каждого канала и делить на 255 (для каждого пикселя на изображении)

### Train (augmentation):

- 1
- a) Random horizontal crop (с очень маленькими отступами от левого правого края)
- b) Random horizontal resize (от 0.8 до 1.2 от исходной ширины, не забываем про ограничение из пункта 2)
- c) Random Gaussian noise
- 3

## Text Recognition

### Архитектура

Реализовать fully-convolutional нейронную сеть:

https://openaccess.thecvf.com/ content\_ICCV\_2017/papers/ Busta\_Deep\_TextSpotter\_An\_ICC V\_2017\_paper.pdf

Type	Channels	Size/Stride	Dim/Act
input	C	-	$\overline{W}  imes 32$
conv	32	$3 \times 3$	leaky ReLU
conv	32	$3 \times 3$	leaky ReLU
maxpool		$2 \times 2/2$	$\overline{W}/2 \times 16$
conv	64	$3 \times 3$	leaky ReLU
BatchNorm			
recurrent conv	64	$3 \times 3$	leaky ReLU
maxpool		$2 \times 2/2$	$\overline{W}/4 \times 8$
conv	128	$3 \times 3$	leaky ReLU
BatchNorm			
recurrent conv	128	$3 \times 3$	leaky ReLU
maxpool		$2 \times 2/2 \times 1$	$\overline{W}/4 \times 4$
conv	256	$3 \times 3$	leaky ReLU
BatchNorm			
recurrent conv	256	$3 \times 3$	leaky ReLU
maxpool		$2 \times 2/2 \times 1$	$\overline{W}/4 \times 2$
conv	512	3  imes 2	leaky ReLU
conv	512	$5 \times 1$	leaky ReLU
conv	$ \hat{\mathcal{A}} $	$7 \times 1$	$\overline{W}/4 \times 1$
